PC Scan & Sweep—instantly rids your computer of performance-slowness, security-compromising *junk* files!

There's a toxic spill in your computer's basement!

[Click here](#) to see all the backed-up sewage inside your computer!

Don't worry we're not going to hijack you computer, or in anyway compromise your computer's security or functionality.

We just want to prove to you that your computer is overflowing with junk files—abandoned links, registry keys and other garbage—that's robbing your computer of both speed and performance.

All computers accumulate junk files over time—it's an unavoidable fact of life. Every time you install or uninstall a program, shut down your computer improperly, or exit a program other than in the recommended fashion (which everyone does) harmful junk files accumulate.

What are junk files—and why you must delete them

A junk file is the computer equivalent of bad cholesterol. It clogs your computer's arteries, making it hard to breathe (transfer data, etc.) and maintain proper and necessary computing speed.

Junk files are abandoned system files, temporary files, registry keys, shortcuts and links that lead nowhere—because the destination program has moved, or was removed, and your computer is now wasting precious time looking for it in all the old and wrong places.

“I do not have to manually delete cookies, temp files and history anymore. Also, it helps with the " little errors" that arise from other people jumping around from site to site without closing out the sites that they are not using anymore. I do not find the need to go in and clean my computer or compress files as much as I did before. Thank you.”

-- S. Ptak, Westmoreland, NY

Junk files accumulate even when it's not your fault!

Poorly-written programs (there are tons of them out there) will create junk files every time they're opened. Those junk files are then placed in your computer's registry—and your computer must access your registry dozens of times every second just to keep running—so imagine how much faster your computer will run if it didn't waste time reading useless registry files a gazillion times a day!

Junk files are also unnecessary, erroneously created “duplicate files” (another fact of life). These duplicate files are housed on your hard drive—robbing you of valuable storage space—which, in turn, taxes your system, eventually wearing it down.

SECURITY ALERT!

Junk files are also used by hackers to access private, valuable information stored on your computer.

How to know if your computer is overloaded with junk files

Ever get a missing “.exe” or “.dll” message? Ever click on a program, and it won't open? Ever have your computer suddenly freeze, roll over and play dead? Your computer is infested with junk files. Annoying, aren't they?

[Click here](#) and all annoying junk files will disappear

With just one click, **PC Scan & Sweep** will perform a deep scan of your computer to reveal *and* remove all junk files clogging your registry, hard drive, and file system.

Plus, it will remove all “temporary” internet files, which can expose your stored private, personal and critical information to hackers.

PC Scan & Sweep...

- Dramatically increases your PC performance.
- Quickly removes potentially harmful junk files.
- Cleans your windows registry in one click.
- Empties all temporary files to protect your personal information.
- Compatible with Windows Vista, XP, ME, 98, and 2000.
